

# AgMRI TIPS Yield Estimate Tool

Automated Crop Intelligence System

The Yield Estimate Tool accounts for variability in fields, giving you more confidence in the numbers so you can market sooner and more confidently.

In the desired field, click the Scout icon, then select yield. The Yield Estimate Tool will give you a choice to use AgMRI or self-guided sampling points. The AgMRI-guided sampling points direct you to points close to the field edge and each other with areas with varying crop health based on the NDVI score.

Perform a manual yield check in each indicated spot and enter the kernels, rows, and ears for each point. You can also enter the price you anticipate, and AgMRI does the rest!

View the field average against the county average, and get a projected return for the field.

The Yield Estimate Tool is particularly useful in a year like this one with so much variability in the fields.
